

Clinical Trials of Hydroxychloroquine to Prevent COVID-19 and Other COVID-19 Resources for Healthcare Workers

Healthcare workers are at high risk of exposure to SARS-CoV-2, the novel coronavirus that causes COVID-19. Currently, there are no vaccines or treatments for COVID-19, but several clinical trials are testing the use of hydroxychloroquine to prevent COVID-19. Hydroxychloroquine is currently approved by the FDA to treat several diseases, but it is not yet approved to prevent or treat COVID-19.

Because healthcare workers are at high risk of exposure, you may be eligible to participate in one these trials. By participating in one of these trials, you can help find a proven way to prevent COVID-19.

New York University COVID-19 PEP Study

NYU, in partnership with the University of Washington and the Gates Foundation, is enrolling healthcare workers who were exposed to COVID-19 patients in a clinical trial of hydroxychloroquine for the prevention of COVID-19. There are no in-person visits; all materials and study drugs will be shipped to you, and you will need a smartphone or other device with internet access to participate in study visits.

For more information about the trial, including how to enroll, visit <http://covid19pep.org/>.

University of Minnesota COVID-19 PEP Clinical Trial

The University of Minnesota is conducting a clinical trial of hydroxychloroquine for the prevention and treatment of COVID-19 in HCWs with close exposure to an individual with confirmed COVID-19. HCWs who are asymptomatic *and* those who are within four days of first experiencing symptoms are eligible for this trial. There are no in-person visits; all materials and study drugs will be shipped to you, and you will need a smartphone or other device with internet access to participate in study visits.

For more information about the trial, including how to enroll, visit <https://covidpep.umn.edu/>.
